

Robot Mapping

Grid-based FastSLAM

Cyrill Stachniss

AIS Autonomous Intelligent Systems

1

Motivation

- So far, we addressed landmark-based SLAM (EKF, SEIF, FastSLAM)
- We learned how to build grid maps assuming “known poses”

Today: SLAM for building grid maps

2

Mapping With Raw Odometry

Courtesy: Dirk Hähnel

3

Observation

- **Assuming known poses fails!**

Questions

- Can we solve the SLAM problem if no pre-defined landmarks are available?
- Can we use the ideas of FastSLAM to build grid maps?

4

Rao-Blackwellization for SLAM

- Factorization of the SLAM posterior

poses map observations & movements

↓ ↓ ↘ ↙

$$p(x_{0:t}, m \mid z_{1:t}, u_{1:t})$$

First introduced for SLAM by Murphy in 1999

5

Rao-Blackwellization for SLAM

- Factorization of the SLAM posterior

poses map observations & movements

↓ ↓ ↘ ↙

$$p(x_{0:t}, m \mid z_{1:t}, u_{1:t})$$

$$= p(x_{0:t} \mid z_{1:t}, u_{1:t}) p(m \mid x_{1:t}, z_{1:t})$$

↑ ↑

path posterior map posterior
(particle filter) (given the path)

First introduced for SLAM by Murphy in 1999

6

Grid-based SLAM

- As with landmarks, the map depends on the poses of the robot during data acquisition
- If the poses are known, grid-based mapping is easy (“mapping with known poses”)

7

A Graphical Model for Grid-Based SLAM

8

Grid-Based Mapping with Rao-Blackwellized Particle Filters

- Each particle represents a possible trajectory of the robot
- Each particle maintains its own map
- Each particle updates it using “mapping with known poses”

9

Particle Filter Example

10

Performance of Grid-based FastSLAM 1.0

11

Problem

- Too many samples are needed to sufficiently model the motion noise
- Increasing the number of samples is difficult as each map is quite large
- **Idea: Improve the proposal** to generate a better prediction. This reduces the required number of particles

12

Improved Proposal

- Compute an improved proposal that considers the most recent observation

$$x_t^{[k]} \sim p(x_t | x_{1:t-1}^{[k]}, u_{1:t}, z_{1:t})$$

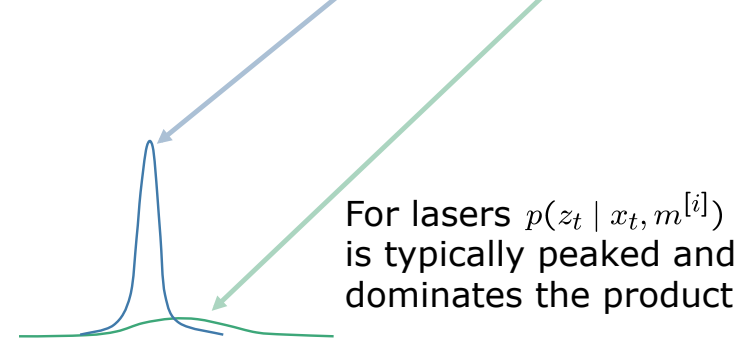

Goals:

- More precise sampling
- More accurate maps
- Less particles needed

13

The Optimal Proposal Distribution [Arulampalam et al., 01]

$$p(x_t | x_{t-1}^{[i]}, m^{[i]}, z_t, u_t) = \frac{p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t)}{p(z_t | x_{t-1}^{[i]}, m^{[i]}, u_t)}$$

14

Proposal Distribution

$$p(x_t | x_{t-1}^{[i]}, m^{[i]}, z_t, u_t) = \frac{\overbrace{p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t)}^{\tau(x_t)}}{p(z_t | x_{t-1}^{[i]}, m^{[i]}, u_t)}$$

15

Proposal Distribution

$$p(x_t | x_{t-1}^{[i]}, m^{[i]}, z_t, u_t) = \frac{\overbrace{p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t)}^{\tau(x_t)}}{p(z_t | x_{t-1}^{[i]}, m^{[i]}, u_t)}$$

$$p(z_t | x_{t-1}^{[i]}, m^{[i]}, u_t) = \int_{x_t} p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t) dx_t$$

16

Proposal Distribution

$$p(x_t | x_{t-1}^{[i]}, m^{[i]}, z_t, u_t) = \frac{\overbrace{p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t)}^{\tau(x_t)}}{p(z_t | x_{t-1}^{[i]}, m^{[i]}, u_t)}$$

$$p(z_t | x_{t-1}^{[i]}, m^{[i]}, u_t) = \int_{x_t} p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t) dx_t$$

$$p(x_t | x_{t-1}^{[i]}, m^{[i]}, z_t, u_t) = \frac{\tau(x_t)}{\int_{x_t} \tau(x_t) dx_t}$$

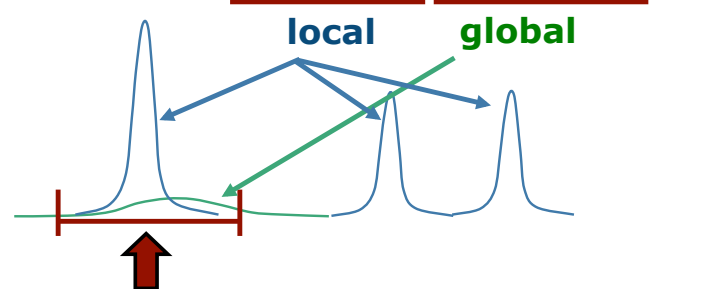

17

Proposal Distribution

$$p(x_t | x_{t-1}^{[i]}, m^{[i]}, z_t, u_t) = \frac{\overbrace{p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t)}^{\tau(x_t)}}{\int_{x_t} \underbrace{p(z_t | x_t, m^{[i]})}_{\text{locally limits the area over which to integrate (measurement)}} \underbrace{p(x_t | x_{t-1}^{[i]}, u_t)}_{\text{globally limits the area over which to integrate (odometry)}} dx_t}$$

18

Proposal Distribution

$$p(x_t | x_{t-1}^{[i]}, m^{[i]}, z_t, u_t) = \frac{\overbrace{p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t)}^{\tau(x_t)}}{\int_{x_t} \underbrace{p(z_t | x_t, m^{[i]})}_{\text{local}} \underbrace{p(x_t | x_{t-1}^{[i]}, u_t)}_{\text{global}} dx_t}$$

19

Proposal Distribution

$$p(x_t | x_{t-1}^{[i]}, m^{[i]}, z_t, u_t) \simeq \frac{\tau(x_t)}{\int_{\{x_t | \tau(x_t) > \epsilon\}} \tau(x_t) dx_t}$$

with $\tau(x_t) := p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t)$

How to sample from this term?

Gaussian approximation:

$$p(x_t | x_{t-1}^{[i]}, m^{[i]}, z_t, u_t) \simeq \mathcal{N}(\mu^{[i]}, \Sigma^{[i]})$$

20

Gaussian Proposal Distribution

$$p(x_t | x_{t-1}^{[i]}, m^{[i]}, z_t, u_t) \simeq \frac{\tau(x_t)}{\int_{\{x_t | \tau(x_t) > \epsilon\}} \tau(x_t) dx_t}$$

Approximate this equation by a Gaussian:

21

Estimating the Parameters of the Gaussian for Each Particle

$$\mu^{[i]} = \frac{1}{\eta} \sum_{j=1}^K x_j \tau(x_j)$$

$$\Sigma^{[i]} = \frac{1}{\eta} \sum_{j=1}^K (x_j - \mu^{[i]})(x_j - \mu^{[i]})^T \tau(x_j)$$

x_j are points sampled around the location x^* to which the scan matching has converged to

22

Computing the Importance Weight

$$w_t^{[i]} = w_{t-1}^{[i]} p(z_t | x_{t-1}^{[i]}, m^{[i]}, u_t)$$

[Arulampalam et al., 01]

23

Computing the Importance Weight

$$\begin{aligned} w_t^{[i]} &= w_{t-1}^{[i]} p(z_t | x_{t-1}^{[i]}, m^{[i]}, u_t) \\ &= w_{t-1}^{[i]} \int_{x_t} p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t) dx_t \end{aligned}$$

24

Computing the Importance Weight

$$\begin{aligned}
 w_t^{[i]} &= w_{t-1}^{[i]} p(z_t | x_{t-1}^{[i]}, m^{[i]}, u_t) \\
 &= w_{t-1}^{[i]} \int_{x_t} \underbrace{p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t)}_{\tau(x_t)} dx_t
 \end{aligned}$$

25

Computing the Importance Weight

$$\begin{aligned}
 w_t^{[i]} &= w_{t-1}^{[i]} p(z_t | x_{t-1}^{[i]}, m^{[i]}, u_t) \\
 &= w_{t-1}^{[i]} \int_{x_t} p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t) dx_t \\
 &\approx w_{t-1}^{[i]} \int_{\{x_t | \tau(x_t) > \epsilon\}} \tau(x_t) dx_t
 \end{aligned}$$

26

Computing the Importance Weight

$$\begin{aligned}
 w_t^{[i]} &= w_{t-1}^{[i]} p(z_t | x_{t-1}^{[i]}, m^{[i]}, u_t) \\
 &= w_{t-1}^{[i]} \int_{x_t} p(z_t | x_t, m^{[i]}) p(x_t | x_{t-1}^{[i]}, u_t) dx_t \\
 &\approx w_{t-1}^{[i]} \int_{\{x_t | \tau(x_t) > \epsilon\}} \tau(x_t) dx_t \\
 &\approx w_{t-1}^{[i]} \sum_{j=1}^K \tau(x_j)
 \end{aligned}$$

 Sampled points around the maximum of the likelihood function found by scan-matching₂₇

Improved Proposal

- The proposal adapts to the structure of the environment

28

Resampling

- Resampling at each step limits the “memory” of our filter
- Suppose we lose each time 25% of the particles, this may lead to:

- Goal: Reduce the resampling actions

29

Selective Resampling

- Resampling is necessary to achieve convergence
- Resampling is dangerous, since important samples might get lost (“particle depletion”)
- Resampling makes only sense if particle weights differ significantly

- **Key question: When to resample?**

30

Number of Effective Particles

- Empirical measure of how well the target distribution is approximated by samples drawn from the proposal

$$n_{eff} = \sum_i \left(w_t^{[i]} \right)^{-2}$$

- n_{eff} describes “the inverse variance of the **normalized** particle weights”
- For equal weights, the sample approximation is close to the target

31

Resampling with n_{eff}

- If our approximation is close to the target, no resampling is needed
- We only resample when n_{eff} drops below a given threshold ($N/2$)

$$\sum_i \left(w_t^{[i]} \right)^{-2} \stackrel{?}{<} N/2$$

- Note: weights need to be normalized
[Doucet, '98; Arulampalam, '01]

32

Typical Evolution of n_{eff}

Intel Lab

- **15 particles**
- four times faster than real-time P4, 2.8GHz
- 5cm resolution during scan matching
- 1cm resolution in final map

34

Intel Lab

35

Outdoor Campus Map

- **30 particles**
- 250x250m²
- 1.75 km (odometry)
- 30cm resolution in final map

39

Real World Application

- This guy uses a similar technique...

40

Problems of Gaussian Proposals

- Gaussians are uni-modal distributions
- In case of loop-closures, the likelihood function might be multi-modal

41

Problems of Gaussian Proposals

- Multi-modal likelihood function can cause filter divergence

42

Efficient Multi-Modal Sampling

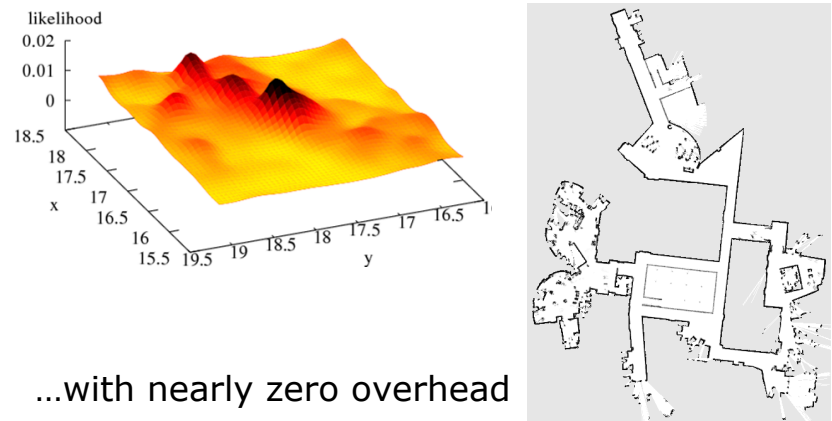

- Approximate the likelihood in a better way!

- Sample from odometry first and then use this as the start point for scan matching

43

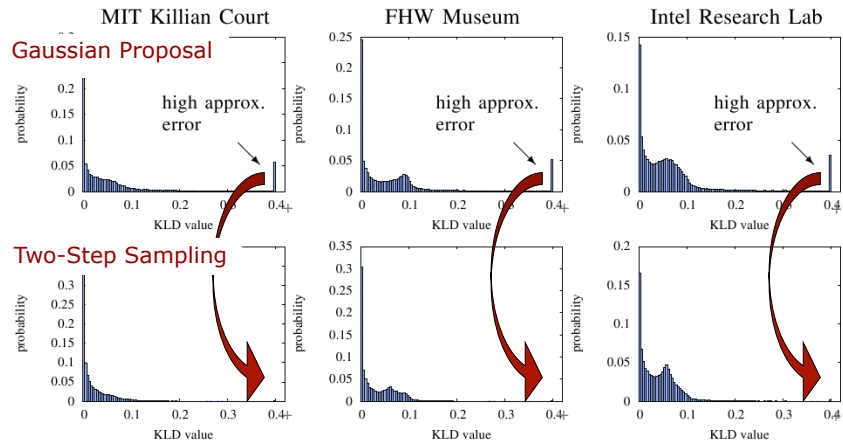

The Two-Step Sampling Works!

...with nearly zero overhead

44

Difference Between the Optimal Proposal and the Approximations

45

Is a Gaussian an Accurate Choice for the Proposal?

Dataset	Gauss	Non-Gauss; 1 mode	Multi-modal
Intel Research Lab	89.2%	7.2%	3.6%
FHW Museum	84.5%	10.4%	5.1%
Belgioioso	84.0%	10.4%	5.6%
MIT CSAIL	78.1%	15.9%	6.0%
MIT Killian Court	75.1%	19.1%	5.8%
Freiburg Bldg. 79	74.0%	19.4%	6.6%

46

Gaussian Proposal: Yes or No?

- Gaussian allow for efficient sampling
- Problematic in multi-model cases
- Laser-baser SLAM: 3-6% multi-modal distribution (for the datasets here)
- Gaussian proposals can lead to divergence
- Two-step sampling process overcomes this problem effectively and efficiently

47

Conclusion

- The ideas of FastSLAM can also be applied in the context of grid maps
- Improved proposals are essential
- Similar to scan-matching on a per-particle base
- Selective resamples reduces the risk of particle depletion
- Substantial reduction of the required number of particles
